

Project WET Climate

KCSOS and California Project WET invite educators of grades 3–12 to a workshop on climate change and its impact on California’s water resources. This hands-on session will explore the connections between climate science, floods, drought, and groundwater, while providing engaging activities to help students understand these challenges and develop solutions. Participants will learn how water managers are addressing climate resilience and how Project WET’s interdisciplinary, standards-aligned activities—featuring models, simulations, and real-world scenarios—can enhance STEAM, project-based, and service-learning programs.
